1933 Feb. 12

THE ROYAL OBSERVATORY,
GREENWICH.

Dear Prof. Daylon Uhley,

We have made certain that we have no records here about the determination of the velocity of sound by Halley's methods. The paper by Deharme (36 pages) gives a full list in the Transactions of the Royal Society says that the time was 13.5 seconds in coming from Shooters Hill to the Observatory.

I am writing to the
Royal Society to find out if they know anything more, and will let you know the result.

My wife and I are very grateful for the photos taken at the Harvard Observatory Lecture Party. They are very interesting souvenirs of a most pleasant visit.

Yours very sincerely,

J.W. Byrom
